

The National Institute of Mental Health needed to digitalize its research and therapeutic practice. This thesis deals with the development of a web platform that provides therapists with tools for collaborating with patients and clients outside of regular therapeutic sessions. Within this work, collaboration in the form of questionnaires was implemented. This functionality can also be used for data collection for research purposes. The application was designed for easy extension with additional forms of collaboration. The application is well prepared for the improvement of the provided care and was successfully delivered to the client.
